

The BaseScreen class is the base class used for all the screens in the game, such as the main menu, the gameplay screen, and the game over screen.

It defines the basic structure that every screen must follow, including methods for initialization, updating game logic, loading content, and drawing graphics on the screen.

This helps keep all screens consistent and organized.

BaseScreen also includes common functionality shared between screens, like keyboard input handling and basic UI resources.

This avoids repeating the same code in multiple classes and makes the project easier to manage.

Thanks to this approach, each screen can focus only on its specific behavior, while the shared logic is handled in one place.

This makes the code cleaner, easier to understand, and simpler to extend.
